Claude Cowork Use Cases for PAC

The purpose of this doc is to detail 2 use cases we can walk our strategic customers through at PAC on `Wednesday, October 14th` in London. We will have 15 minutes to present.

The goal is to receive feedback on AI adoption, willingness to provide tools like Claude to scale their sales reps and what types of features our customers would like us to build that could help scale their sales organizations and grow revenue the most.

Use Case 1: AI-Powered Daily Wrap-Up & Intelligent Cart Creation

Target Persona: Sales Representative / Account Executive

Context & Trigger: It's 4:30 PM. Throughout the day, the Sales Rep has engaged multiple clients (let's say 10+) across fragmented channels: logged phone calls, email threads, and Google Meet (Hangouts) transcripts. In these chats, the rep promised to set up future product recommendations, check what similar buyers are purchasing, and process immediate orders. The rep opens the Claude Cowork interface to synthesize the day's work.

Primary Goal: Seamlessly translate unstructured multi-channel conversations into actionable Salesforce B2B Commerce artifacts (Carts and Order Templates), augment them with lookalike-audience product recommendations, and push them to buyers via SMS.

User Flow for Prototype (Step-by-Step for UX):

1. **Initiation:**
    a. The rep opens the Claude Cowork panel (let's make sure we have a good visual for the sidebar) and runs a specific prompt or clicks a suggested skill button: *"Run Daily Wrap-Up for today's customer conversations."*
2. **AI Synthesis & Generation (Processing State):**
    a. Claude briefly visualizes its work, showing indicators that it is scanning today's emails, call transcripts, and Hangouts messages to extract product mentions and intent (e.g., "Need now" vs. "Products Discussed").
3. **Review & Refine (The Core UI Interaction):**
    a. The UI presents a summary dashboard of all clients interacted with that day. For each client, the UI displays two distinct sections:
        i. **Active Carts:** Products the customer stated they needed *immediately*.
        ii. **Order Templates:** Products recommended for *future* ordering.

    b. **The AI Upsell Magic:** Within the Order Templates, the UI highlights up to 5 additional products with an "AI Suggested" tag. A tooltip or brief description explains *why* (e.g., *"Added because 75% of similar Mid-Market Manufacturing clients buy these alongside [Base Product]"*).
4. **Approval & Natural Language Commands:**
    a. The rep reviews the summary. They have the option to click into a specific client to modify quantities/items, but choose to approve them all at once.
    b. Instead of clicking a standard "Submit" button, the rep types/speaks a final command to Claude: *"Create these carts and templates. Also, text these buyers letting them know I set this up based on our chat today, and include the direct link."*
5. **Execution & Confirmation:**
    a. Claude confirms the creation of the records in Salesforce B2B Commerce and displays a preview/status of the SMS messages successfully dispatched to the buyers.

Use Case 2: Autonomous Retention Agent & Dynamic Dashboarding

Target Persona: Sales Representative / Account Executive

Context & Trigger: The Sales Rep has already created a standard Salesforce list view of "At-Risk Accounts." Knowing they don't have the bandwidth to monitor this list of thousands manually every day, they decide to deploy a long-running Claude Cowork agent to automate a win-back engagement based on dynamic criteria, while keeping an eye on the results.

Primary Goal: Set up an autonomous, rules-based AI agent that monitors dormant accounts daily, automatically generates and sends personalized, discounted quotes, builds a tracking dashboard, and reports back after a one-week trial.

User Flow for Prototype (Step-by-Step for UX):

1. **Initiation & Command:**
    a. The rep is looking at their "At-Risk Accounts" list view. They open Claude Cowork and type a complex set of instructions: *"For any account on this list that hasn't ordered in 30 days, engage them with an approved quote for their most ordered product. Set the quantity based on their historical average, and apply a 5% discount. Run this daily. Also, build me a dashboard on this view showing quotes sent vs. resulting orders. Run this for 1 week, then send me a summary so we can decide whether to keep going or pivot."*
2. **Agent Configuration & Confirmation (Safety & Trust Check):**
    a. Claude translates this natural language request into a visual "Agent Configuration Card."
    b. The card clearly outlines the parameters for the rep to verify before setting it live:
        i. **Trigger:** At-Risk List + 30 Days No Order (Checks Daily)
        ii. **Action:** Generate & Send Approved Quote (Most ordered item, dynamic average quantity, 5% discount applied)

iii. **Duration:** 7 Days

c. The rep clicks "Deploy Agent."

3. **Dynamic UI Update (Dashboard Creation):**
   a. Instantly, the UI shifts. Claude confirms the agent is active and dynamically generates a new dashboard widget directly above or alongside the "At-Risk Accounts" list view.
   b. The widget features two primary KPIs: *Win-Back Quotes Sent* and *Orders Converted from Quotes*.
4. **The One-Week Check-in (Proactive AI Notification):**
   a. *(The prototype fast-forwards 7 days)*. The rep receives a proactive notification from Claude Cowork (e.g., a badge on the AI icon or a persistent message at the top of the screen).
   b. Opening the AI panel, Claude presents the "Campaign Summary": *"Your 7-day retention agent has finished. We sent 872 quotes and won back 370 accounts (42% conversion rate) totaling $X in revenue. Would you like to extend this agent, increase the discount, try a new strategy, or do something different for the 502 customers still at risk?"*
   c. The rep is given quick-reply buttons (e.g., "Extend for 30 days," "Change discount to 10%," "Stop agent").
