Claudeforce x Commerce - PAC Demo Storyline

Core story

What could a sales rep achieve in the future if Salesforce Commerce kept working on their behalf even if they aren't actively working?

Act I - Set up three long-running agents

Aaron starts in Cowork as a seller. He sets up three ongoing responsibilities, each showing a different way long-horizon agentic work can operate.

Agent 1 - Event/threshold-driven

What should the agent watch for, what should trigger it, what can it do, and when should it involve the seller?
Example prompt -

> *"Keep an eye on my strategic accounts for the next 60 days. If you detect a meaningful change in buying behavior, order activity, inventory availability, or another signal that could put revenue at risk, investigate it using Salesforce data. Take any low-risk actions you can within our existing policies. If the actions affect pricing, margins, or require and exception, bring it to me with your recommendation and the evidence behind it."*

Cowork flow -

1. Aaron types the prompt
2. Claude confirms what it will monitor and the guardrails
3. Agent becomes active
4. Time passes
5. Salesforce threshold signal wakes the agent
6. Agent investigates using Commerce data/tools
7. Agent acts or escalates
8. Aaron later sees what happened while he was away

Agent 2 - Goal-based

What commercial outcomes should the agent pursue over time, and what Salesforce capabilities could help it make progress?
Example prompt -

“Help me generate an additional $500K in credible revenue from my top 20 accounts before the end of the quarter. Look for reorder, expansion, cross-sell, or upsell opportunities using Commerce activity and account context. Keep working toward the target as new signals appear. Stay within our pricing and margin policies, and ask me before making any commitment that requires seller approval.”

Cowork flow -

1. Aaron gives Claude the outcome
2. Claude proposes how it will pursue it
3. Aaron adjusts the guardrails if needed
4. Agent starts working towards the goal
5. New Salesforce signals create new opportunities over time
6. Claude investigates and progresses them
7. Aaron sees progress against the target when he returns

Agent 3 - Time/Cadence-based

What repeated part of the seller’s job should Claude take over, and what should it deliver each time?

Example prompt -

“Every weekday for the next 30 days, review my active accounts before I start work. Look for Commerce activity that needs attention, investigate anything unusual, and handle whatever can be resolved within policy. By 9AM, give me only opportunities, risks, or decisions that genuinely need me, with the relevant Salesforce context already pulled together.”

Cowork flow -

1. Aaron defines the recurring responsibility
2. Claude confirms frequency, duration, and scope
3. Work runs repeatedly
4. Routine issues are handled without seller
5. Important decisions accumulate for Aaron
6. Aaron starts the day with a prepared brief rather than doing the investigation himself

---

Act II - Turn messy customer context into Commerce objects and outcomes

Aaron opens a fresh Cowork chat, and adds a voice note, photo, presentation, spreadsheet, etc.

“I just got back from a meeting with this customer. Here are my voice notes, the deck they shared, a photo I took, and the spreadsheet they sent me. Go through everything here and help me turn it into the best next commercial step.”

:claude-1: I went through all the meeting material. They appear to be planning [customer objective] with an initial requirement of [requested products/quantities/categories].
:claude-1: I also checked what we already know about the customer in Commerce

Visible tool activity -

- Customer profile and order history
- Previous purcahses
- Catalog and product entitlements
- Customer-specific pricing
- Inventory and availability
- Current carts/open orders
- Relevant commercial policies

:claude-1: There are three things worth knowing before following up -

- They asked for `A`, and I found the matching item in our catalog
- They also described a need for `B` in the voice note, even though it never appeared in their spreadsheet. I’d recommend adding `B`
- One item they requested `X` isn’t available in this region. The closest compatible option we sell is `Y`, which meets their requirements

“Why are you recommending `Y`?

:claude-1: In the meeting recording they said `customer requirement` . `Y` satisfies that requirement, is available in the quantity they need, and this customer has previously purchased `related product` so it also fits their current setup.

“How does this compare with what they normally buy from us?”

:claude-1: Their last three orders were primarily `order data` . This request is different because `meaningful change in buying behavior` . It looks like `expansion/new site/replenishment/new project` than a routine order.

“What would you recommend we offer them?“

:claude-1: I’d propose `recommended assortment/type` . That covers what they requested for, substitutes `Y` for the unavailable item, and adds `Z` because of `inferred customer need` .
One decision I need from you.
`Commercial issue description`
Option A: ...

Option B: ...
I recommend option B because of `reason`

Selects B
:claude-1: I've prepared the cart `cart ID` with an order template `template` and other artifacts needed for the customer.

"Go ahead and place the order. It is approved"
:claude-1: *Completes order fulfillment workflow*
